

5 Core Biology Concepts

Information Flow, Exchange & Storage

Cells, organs and organisms have multiple mechanisms to perceive and transmit information

Evolution

The diversity of life arose over time by processes of mutation, selection, and genetic drift

Systems

Living systems and pathways are interconnected and respond dynamically to changes in their environment

Structure and Function

Biological structures, from molecules to ecosystems, impact function

Transformations of Energy & Matter

Biological systems are governed by the laws of thermodynamics

study guide: information flow II

You should be able to:

Compare and contrast the structure & function of RNA and DNA

Describe the process of transcription & translation, including a description of the necessary factors and their specific functions

Compare and contrast transcription in prokaryotes and eukaryotes

Convert DNA seq--> RNA seq--> protein (with codon table)

Predict how disrupting a part of the transcription or translation machinery would affect mRNA and/or protein synthesis

Explain the different levels of protein structure and the bonds involved in each

Explain the properties of an amino acid when provided with its structure

Know the cellular location of transcription & translation in prokaryotes and eukaryotes

Predict how changes in affinity of sigma for a promoter could impact transcription

Provide an example of how a change in genotype could impact phenotype and fitness

study guide vocabulary: information flow II

**You should be able to use these words/phrases appropriately while completing
the tasks described in the previous slide**

affinity	start codon/stop codon
template vs. non-template strand	amino acid
upstream/downstream	promoter
RNA Polymerase	translocation (of the ribosome)
Sigma	primary/secondary/tertiary/quaternary
R group	structure
ribose vs. deoxyribose	
acidic/basic	
peptide bond	
ribosome	
mRNA	
tRNA	
Ribosome E, P, and A sites	
ribosome binding site	
codon/anti-codon	

Announcements:

- Office Hours Wednesday 3:30-4:20 Kane 234
- Review Session Thursday 2:30-3:20 Kane 120
- Exam Friday

Information Flow ii

- Transcription
- Translation
- Protein Structure & Mutations

Information Flow, Exchange & Storage

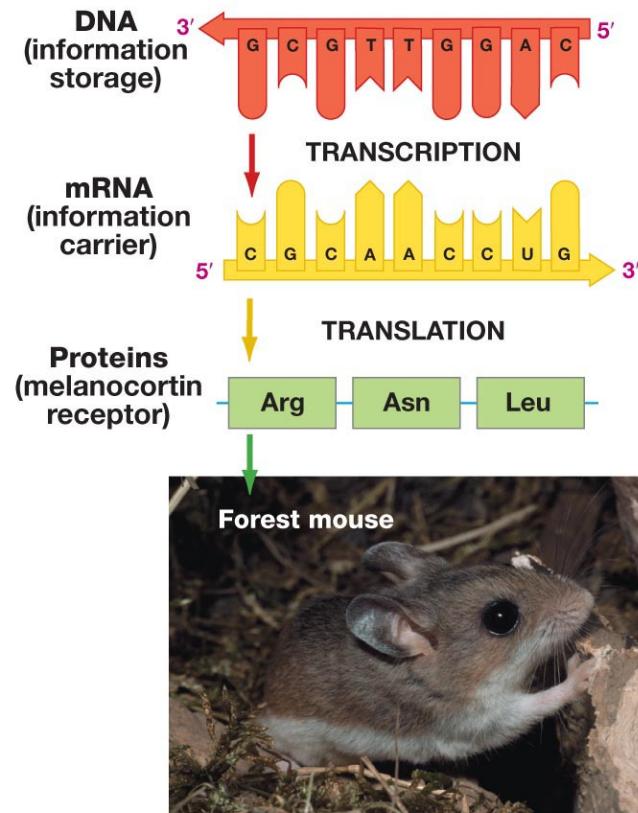

Cells, organs and organisms have multiple mechanisms to perceive and transmit information

Studying for Exam

- Exam covers material through lecture wednesday and central dogma lab
- Use study guides & vocabulary lists (1st slides of each lecture packet)
- Practice exam questions: write answers, check with key on Thursday
(are your answers complete?)
- Office hours Wed 3:30-4:20 Kane 234
- Review session Thur 2:30-3:20 Kane 120
- T.A. office hours!
- TriBeta: M-Th 3:30-6:30 HCK (4th floor lounge)
- For text: focus on figures mentioned during lecture (answer Q's in text and do the "you should be able to" activities)
- Ask yourself questions:
 - How does structure of DNA make it well-suited to store information?
 - What would happen to transcription if you added a poison to a cell that inhibited sigma binding?

Genetic Information Flows From DNA to RNA to Proteins

Today: Focus on Transcription

© 2011 Pearson Education, Inc.

GENOTYPE

What is the product of Transcription?

PHENOTYPE

What is the product of Translation?

Fig. 16.4

What is a gene?

What does it mean to “express” or “turn on” a gene?

Are all genes “turned on” all the time?

Representation of a Gene

Where is upstream for this gene?

Where is the promoter and what does it do?

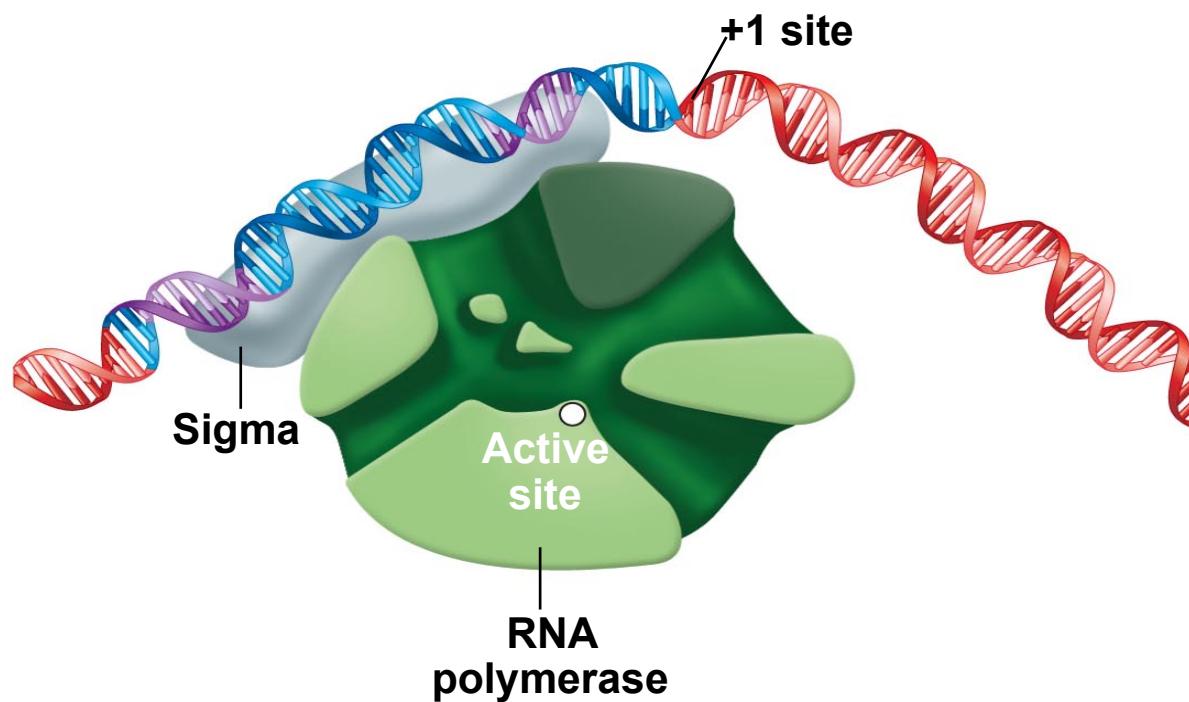

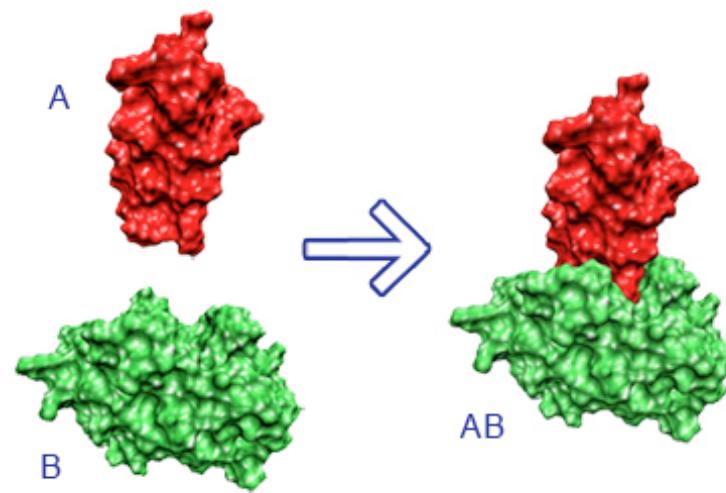

Fig. 17.3

Molecular Affinity

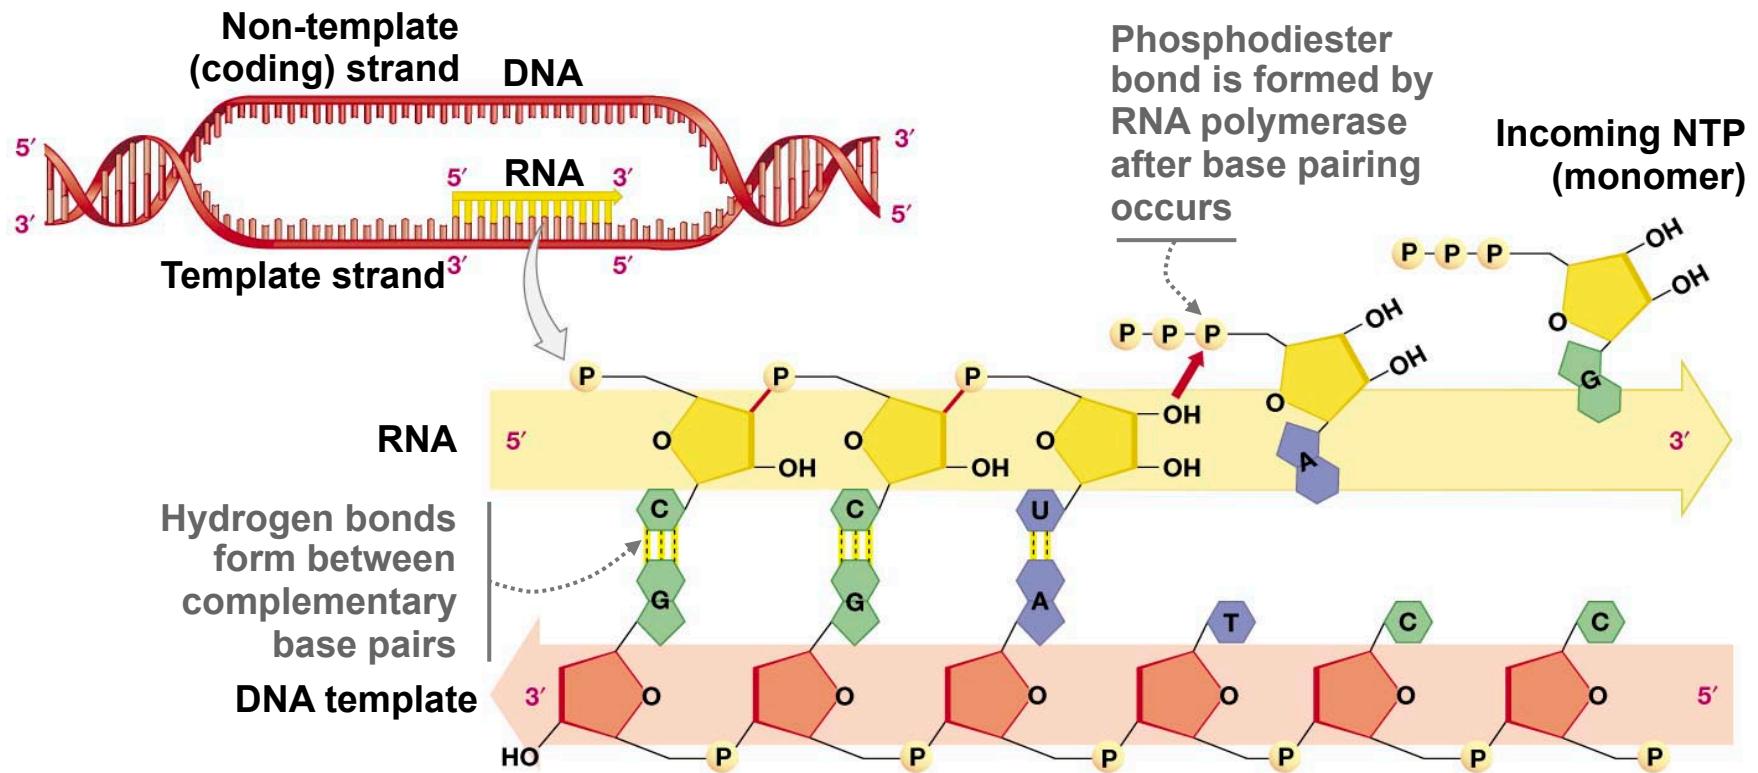

Level of attraction between two molecules:

High/strong affinity = high probability of an interaction

Low/weak affinity = low probability of an interaction

All interactions in the cell are **dynamic**

Which strand is the new RNA complementary to?

What would happen if covalent bonds formed between DNA and the newly made RNA?

Fig. 17.1

Transcription Initiation

What is required for RNA polymerase to initiate transcription?

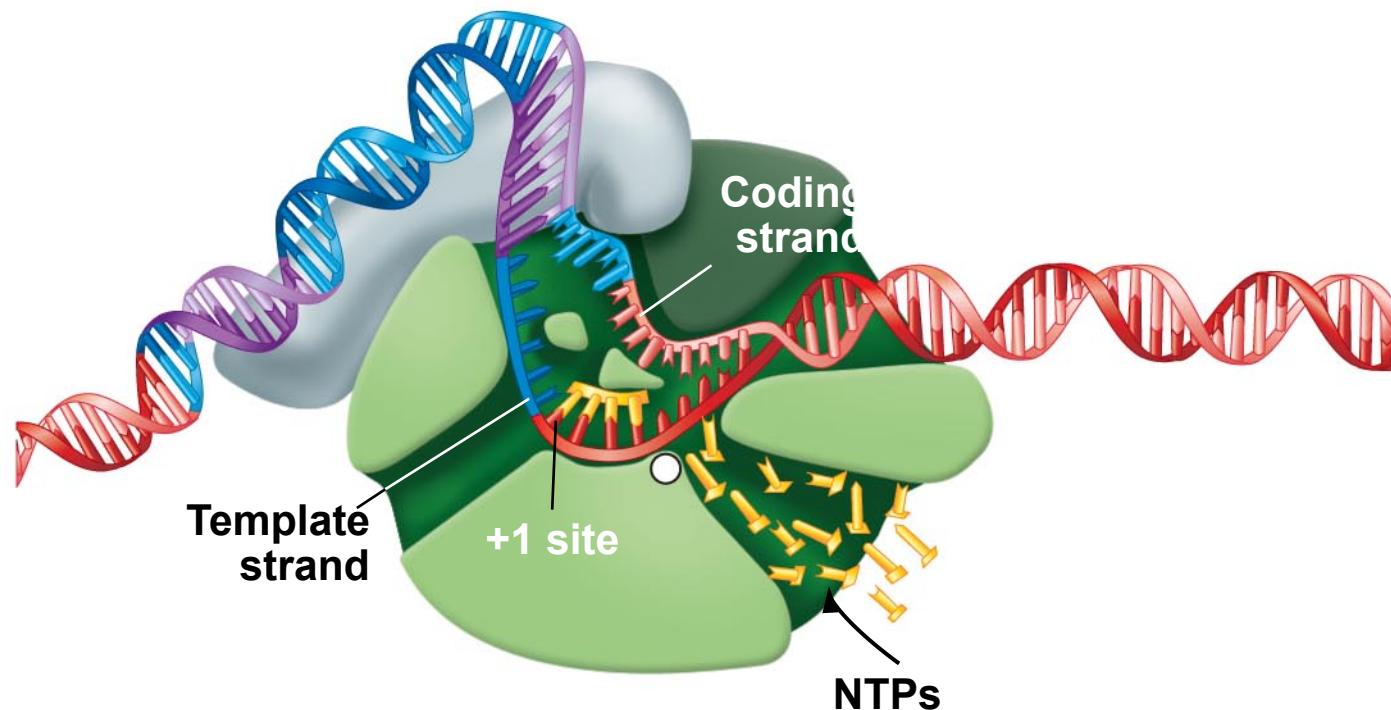

Fig. 17.3

Transcription Termination

What happens after transcription terminates:

To the RNA polymerase?

To the DNA?

To the mRNA?

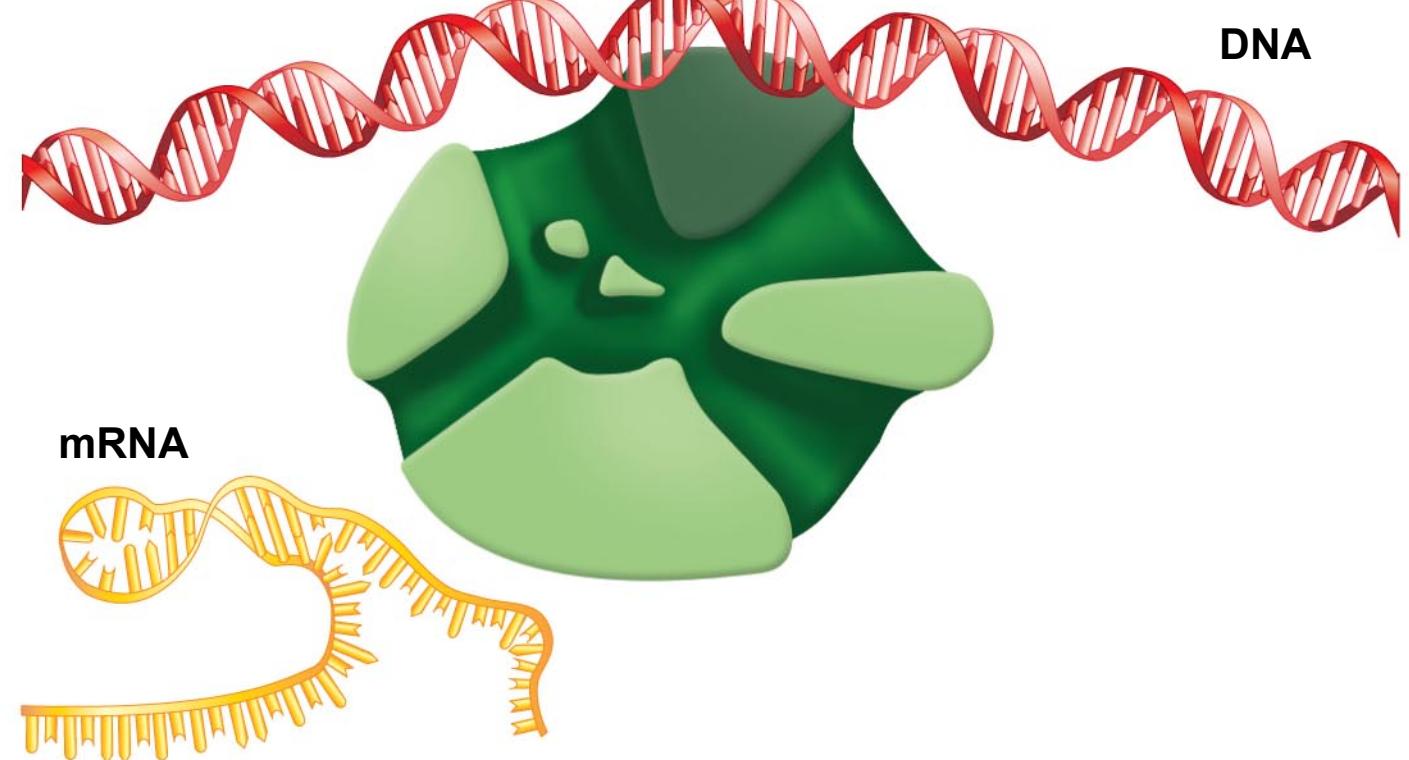

Fig. 17.4

What do we mean when we say that transcription is a way to optimize phenotype

genotype

phenotype

fitness

Why do these 2 plants with the same genotype have a different phenotypes?

At home:

Compare and contrast transcription in prokaryotes and eukaryotes (how is it similar, how is it different?)

Table 17.1: compares prok and euk transcription

study guide: information flow II

After this lecture you should be able to:

compare and contrast the structure & function of RNA and DNA

describe the processes of transcription & translation, including a description of
the necessary factors and their specific functions

convert DNA seq--> RNA seq--> protein (with codon table)

Announcements:

- Office Hours Wednesday 3:30-4:20 Kane 234
- Review Session Thursday 2:30-3:20 Kane 120
- Exam Friday

Information Flow II

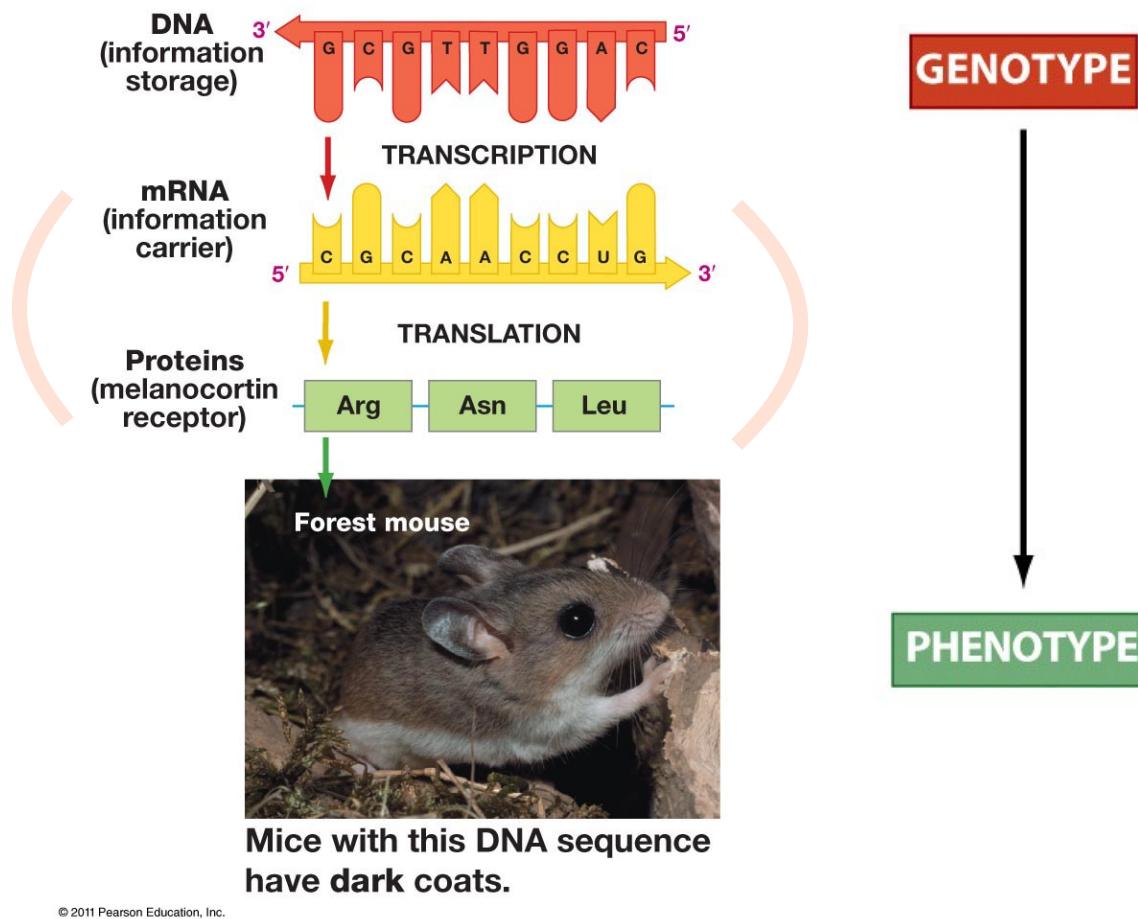

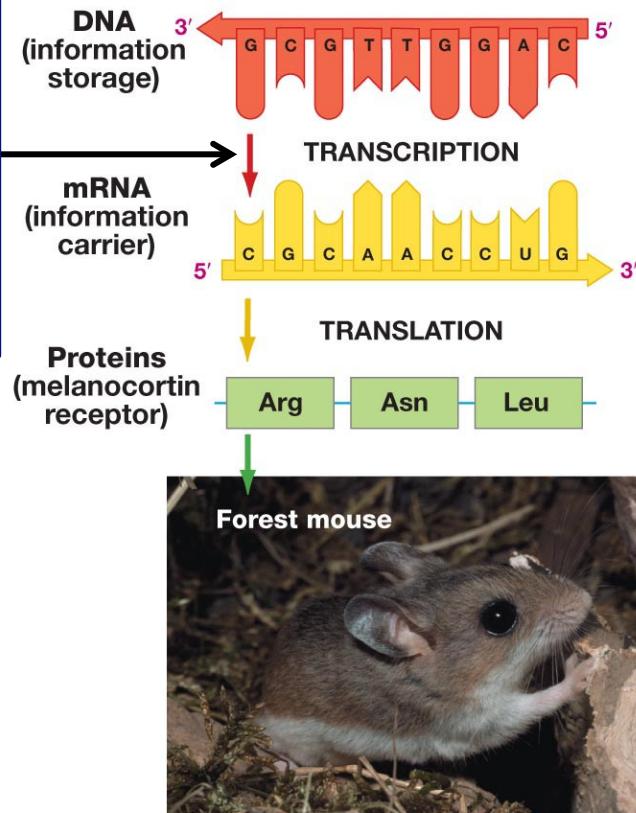

Fig. 16.4

Genetic Information Flows From DNA to RNA to Proteins

Today: Focus on Translation

What does this arrow mean?

© 2011 Pearson Education, Inc.

GENOTYPE

PHENOTYPE

What enzyme is making protein from RNA?

Do all genes code for proteins?

Fig. 16.4

The codon table

		SECOND BASE					
		U	C	A	G		
FIRST BASE	U	UUU UUC UUA UUG	UCU UCC UCA UCG	UAU UAC UAA UAG	UGU UGC UGA UGG	Cysteine (Cys) Stop codon Stop codon	UCAG
	C	CUU CUC CUA CUG	CCU CCC CCA CCG	CAU CAC CAA CAG	CGU CGC CGA CGG	Histidine (His) Proline (Pro) Glutamine (Glu)	UCAG
	A	AUU AUC AUA AUG	ACU ACC ACA ACG	AAU AAC AAA AAG	AGU AGC AGA AGG	Arginine (Arg) Serine (Ser) Arginine (Arg)	UCAG
	G	GUU GUC GUA GUG	GCU GCC GCA GCG	GAU GAC GAA GAG	GGU GGC GGA GGG	Alanine (Ala) Aspartic acid (Asp) Glutamic acid (Glu)	UCAG
Copyright							

- What does AAA code for? Lysine
- If a mutation changed a UCA to UAA, what would happen? serine → stop codon
 - multiple codons code for the same
- What does it mean to say that the code is redundant?
- What does it mean to say that the code is nonrandom?
 - each one of the codons always code for the same amino acid

At home: Using the DNA below (and assuming promoter is to the left)

5' GGC ATG CCC CTG GAG TGA CAT 3'
 3' CCG TAC GGG GAC CTC ACT GTA 5'

Complete the mRNA sequence and the protein sequence.

		SECOND BASE					
		U	C	A	G

Fig. 16.6

Can tRNAs with different anticodons carry the same amino acid?

YES.

What 2 features can differ between tRNAs?

anticodon, amino acids

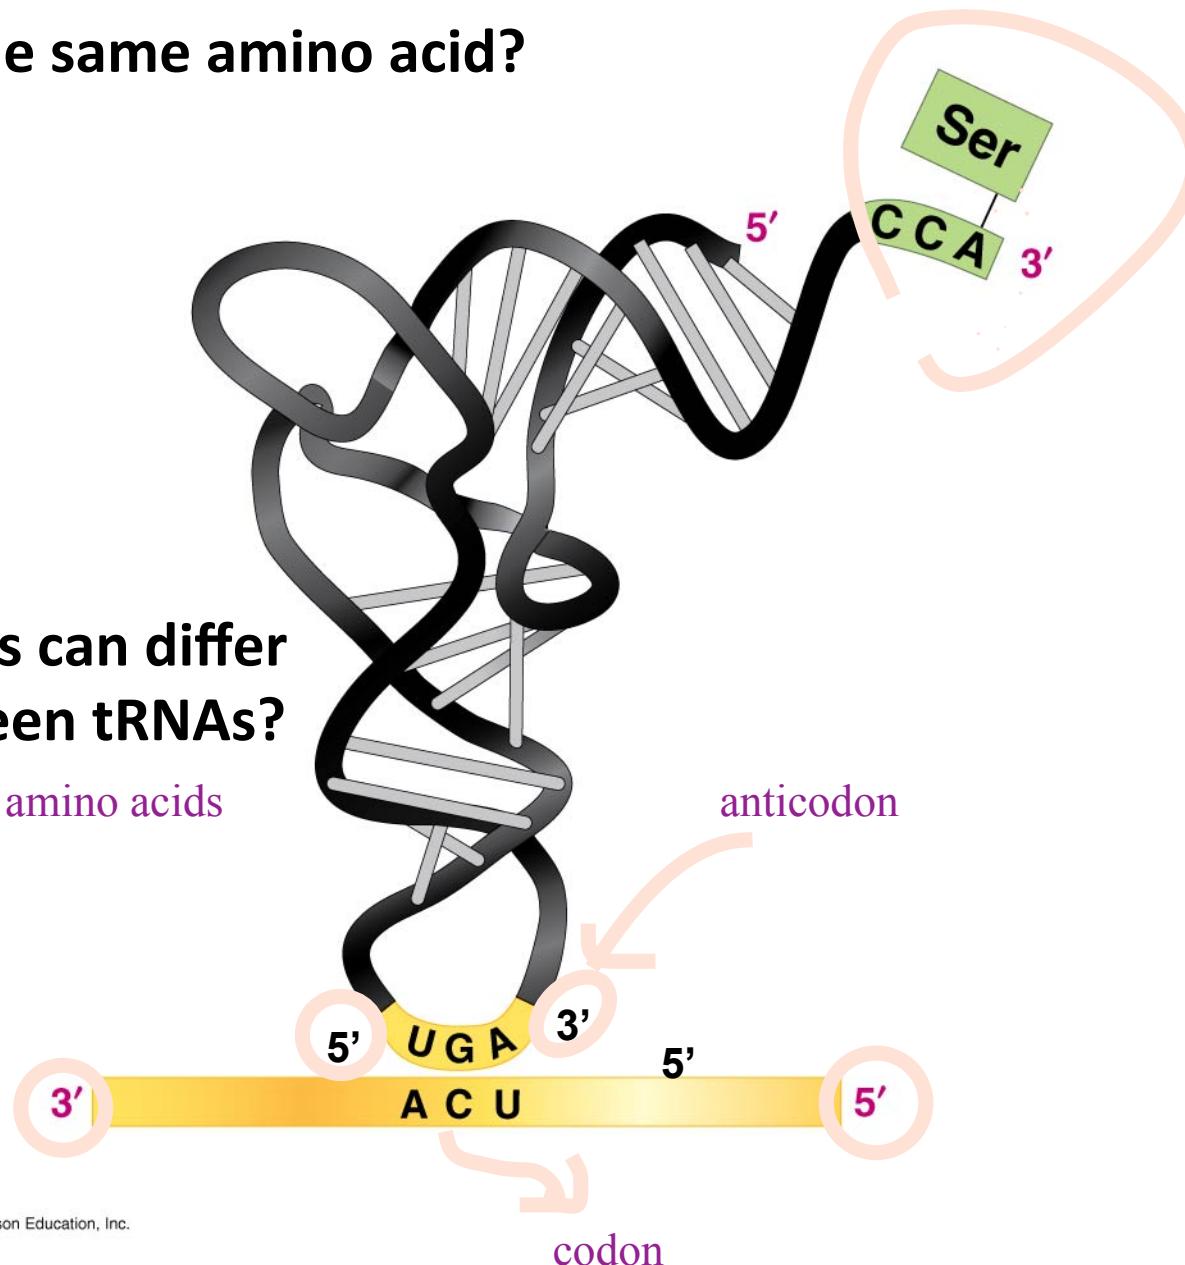

Fig. 17.11

Main points: Protein Translation

- Ribosomes translate messenger RNA (mRNA) into protein with the help of intermediary molecules called transfer RNAs (tRNAs)
- Initiation of translation occurs at the first start codon (AUG) downstream of a purine-rich ribosome binding site
- The initiating tRNA binds the AUG and carries the amino acid methionine
- Each transfer RNA carries an amino acid corresponding to its anticodon
- Peptide bond formation is catalyzed by the ribosome (RNA in the active site)
- Termination of protein synthesis occurs when a Release factor (protein) binds in the “A” site of the ribosome
- Codon = set of 3 nucleotides in DNA or RNA that codes for a certain amino acid or that terminates protein synthesis (e.g. stop codon)
- Anticodon = set of 3 ribonucleotides in the tRNA that is complementary to the codon on the mRNA

Announcements:

- Office Hours Wednesday 3:30-4:20 Kane 234
- Review Session Thursday 2:30-3:20 Kane 120
- Exam Friday

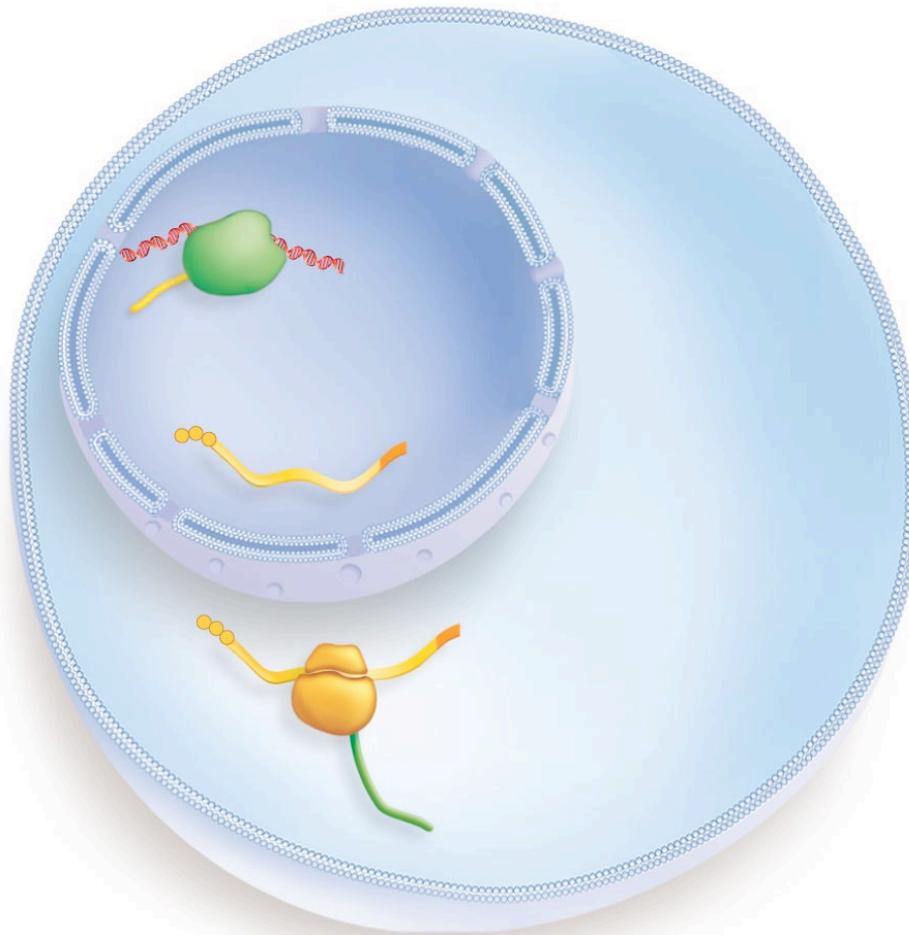

Information Flow II

- Transcription
- Translation
- **Protein Structure & Mutations**

Information Flow, Exchange & Storage

Cells, organs and organisms have multiple mechanisms to perceive and transmit information

Where do transcription and translation occur in a eukaryote?

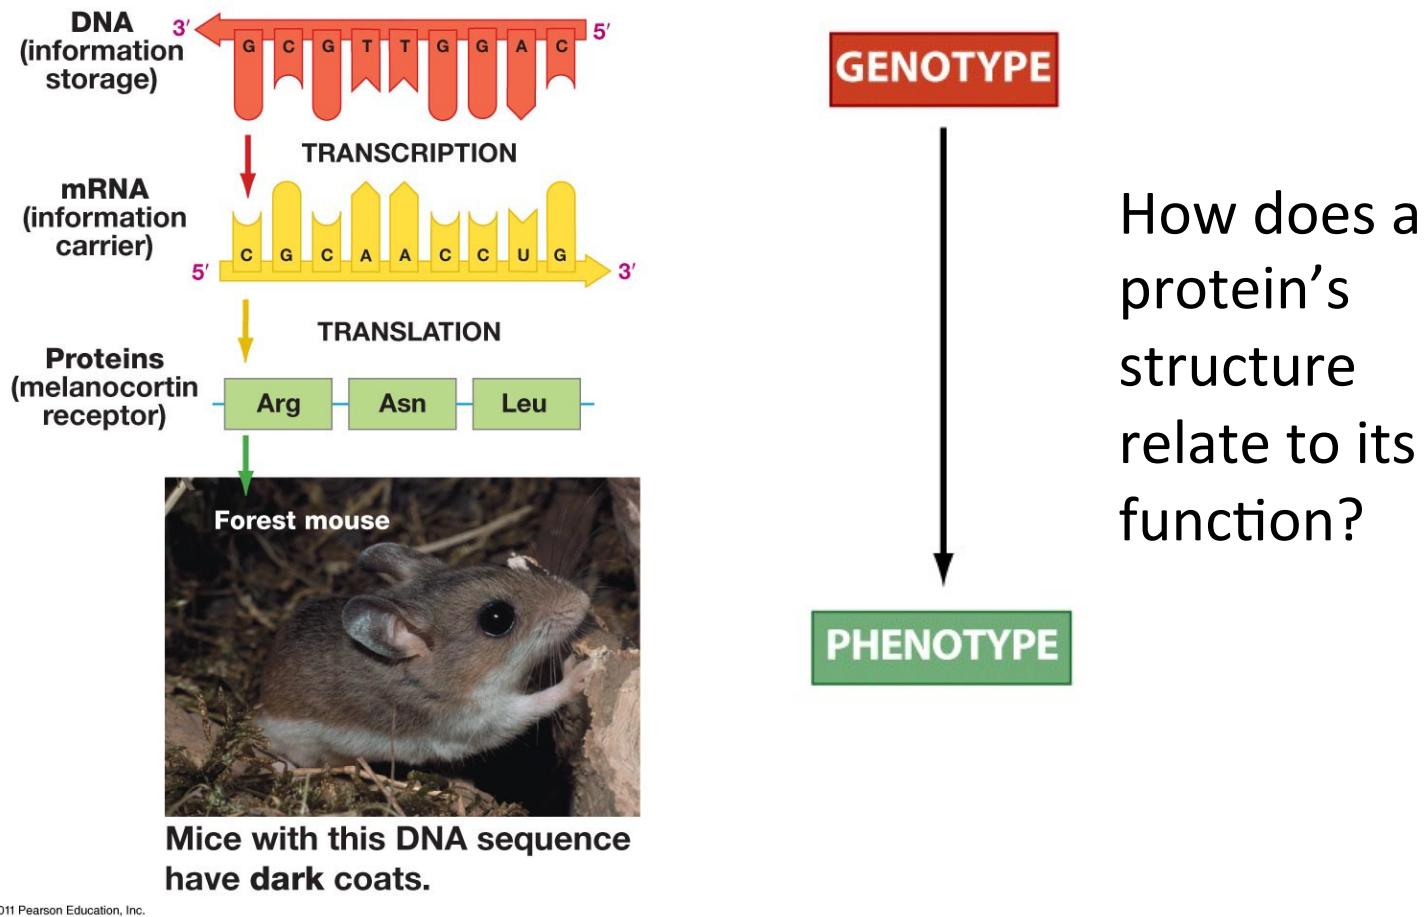

Label on diagram:
protein,
DNA,
RNA,
RNA polymerase,
ribosome

Fig 16.3

Practice at home: Draw a similar diagram for a prokaryote

Genetic Information Flows From DNA to RNA to Proteins

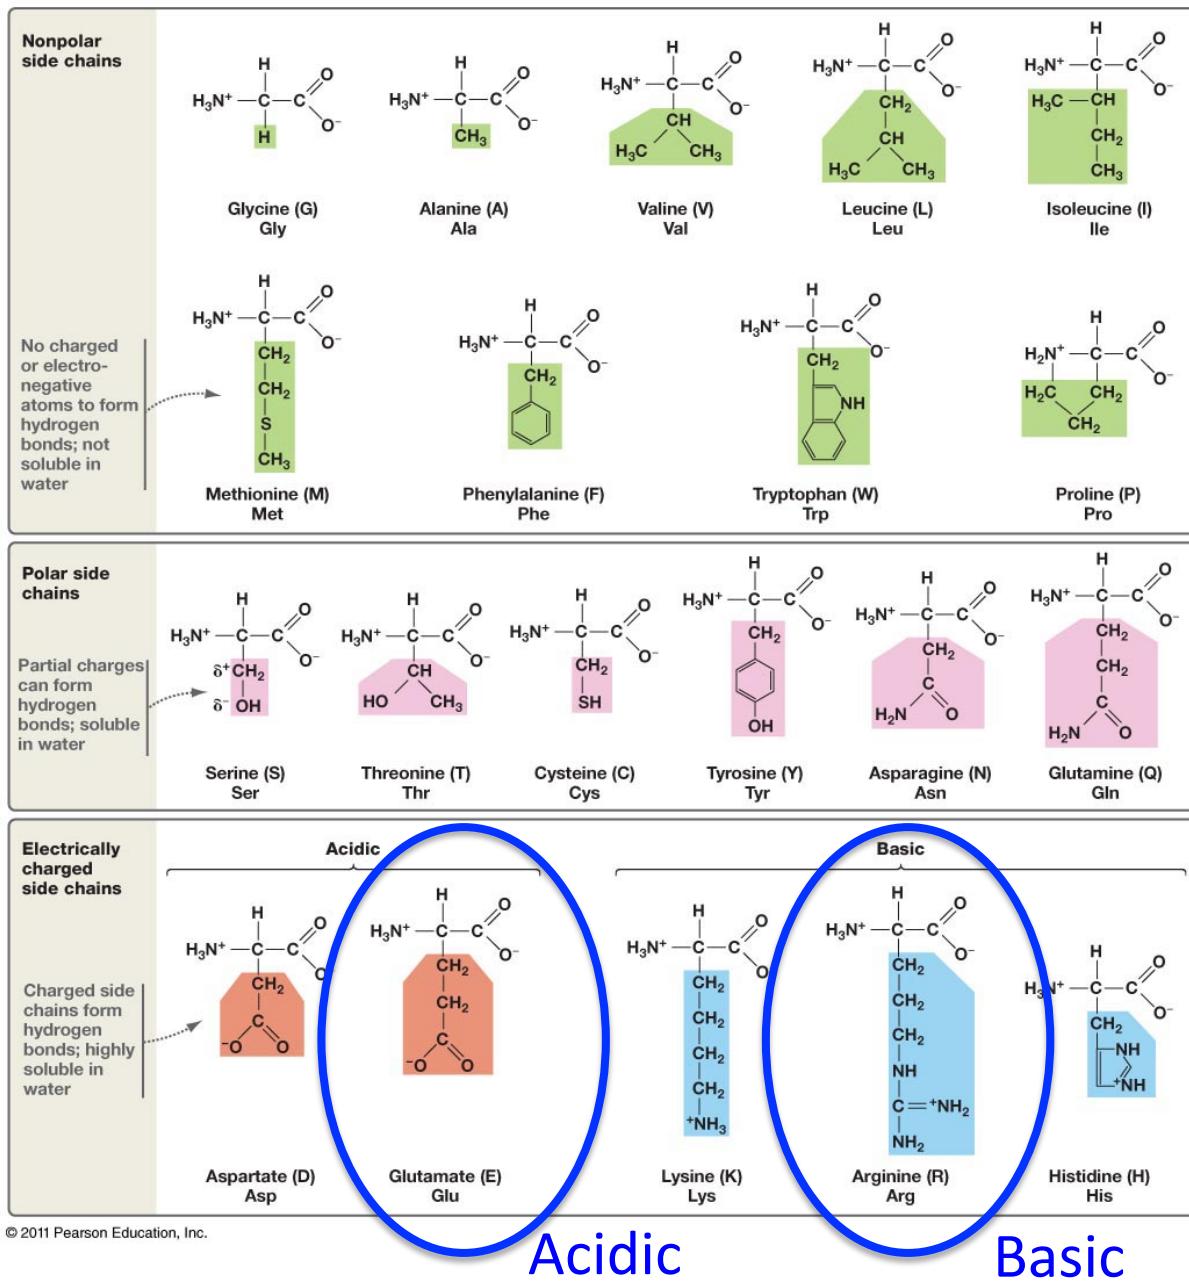

Today: Focus on Protein Structure & Mutation

© 2011 Pearson Education, Inc.

Fig. 16.4

The 20 Major Amino Acids Found in Organisms

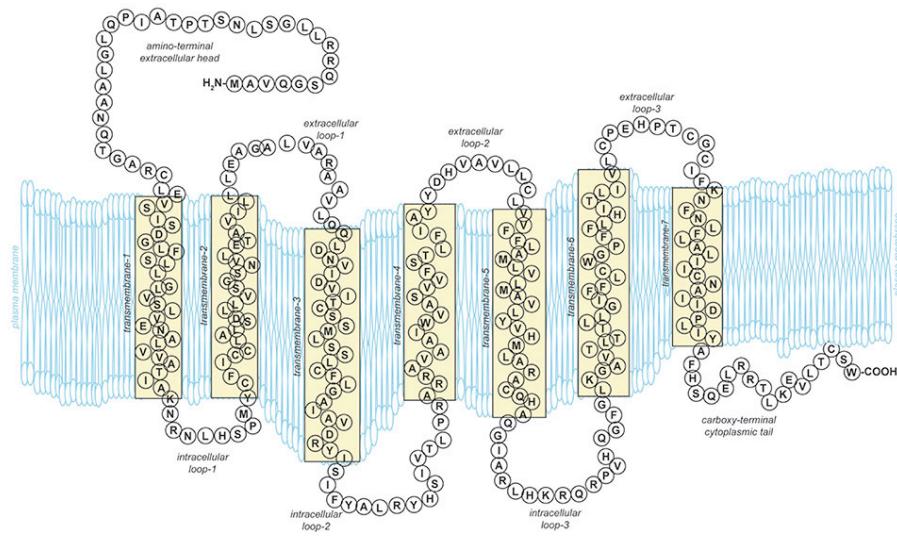

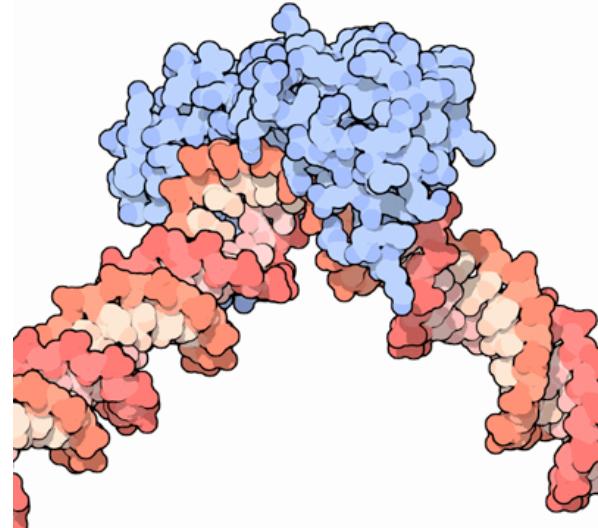

You should be able to identify which amino acids are acidic/basic given their structure

Refer back to
Chemistry of Life
POGIL on what it
means to be
hydrophilic/
hydrophobic

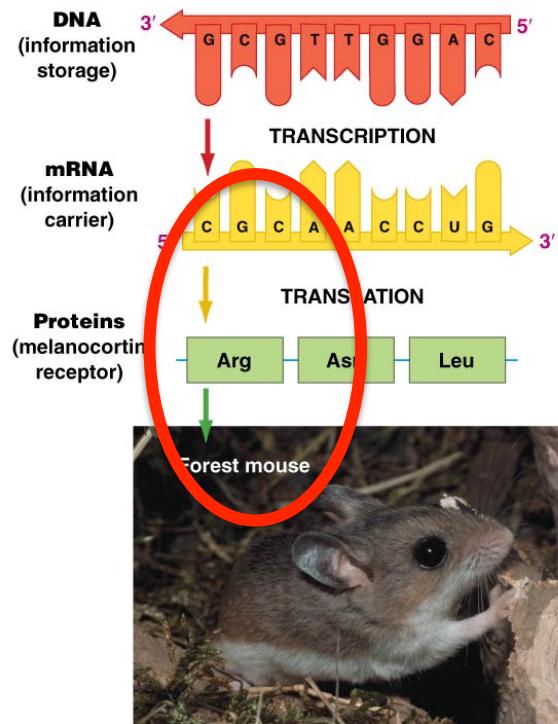

Do not need to
know how to
draw any
structures!

Fig. 3.2

Structure = Function

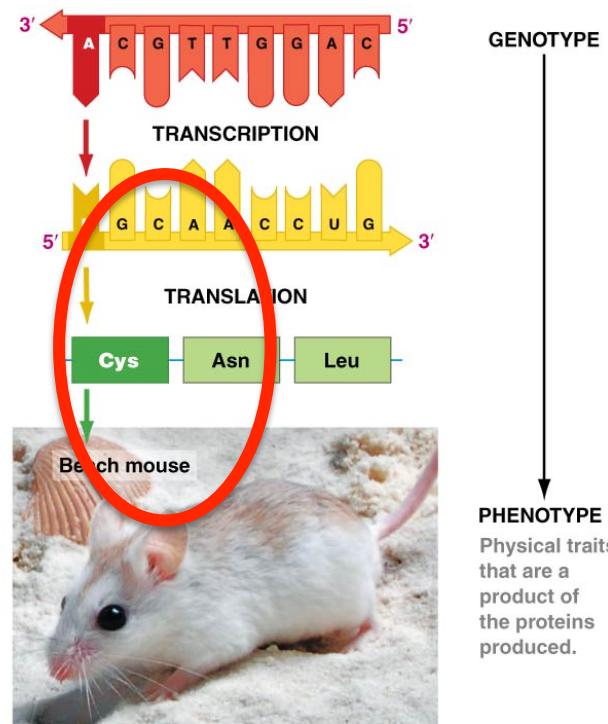

(a) Genetic information flows from DNA to RNA to proteins.

sequence have **dark coats**.

(b) Differences in genotype may cause differences in phenotype.

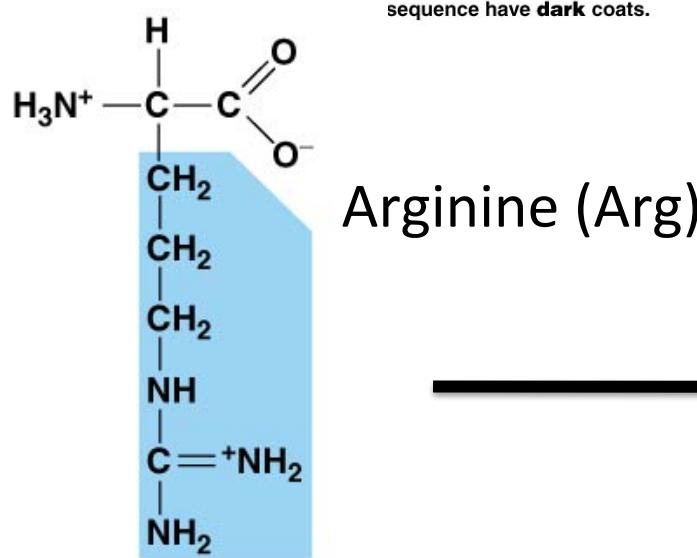

GENOTYPE
Physical traits that are a product of the proteins produced.

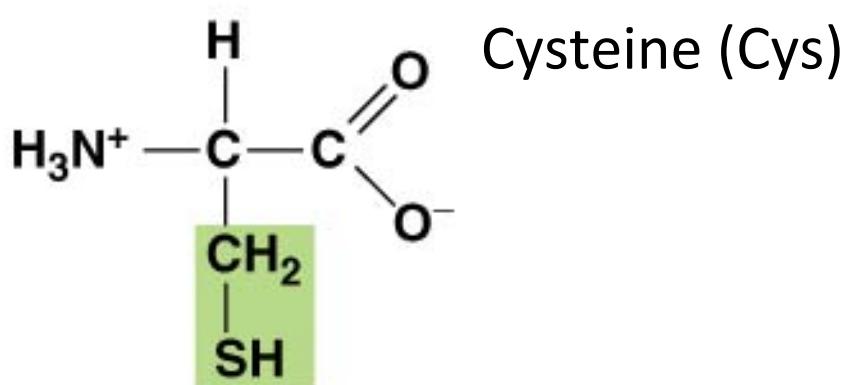

PHENOTYPE

Mice with this DNA sequence have **light coats**.

How could this change in the gene for melanocortin receptor cause a change in receptor function?

Arginine (Arg)

Cysteine (Cys)

Study Suggestions

- AT HOME: Review **BIG PICTURE of DNA/RNA/protein** on pp. 396-397
(Great concept map linking many concepts/processes!)
- AT HOME: Practice converting DNA to mRNA and protein in Fig. 16.7.
- See Table 16.1 for examples of types of mutations: not responsible for knowing the names of different mutation types
